Homework 5 Solutions

$$E_{rel} = \frac{-(E_n)^2(4n-3)}{2mc^2(2+1/2)}$$
 and $E_{spinorbit} = \frac{+(E_n)^2}{mc^2} \frac{n(j(j+1)-2(2+1)-3)}{2(2+1/2)(2+1)}$

$$\begin{aligned}
& \mathcal{E}_{rel}^{1} + \mathcal{E}_{spin \text{ orbit}}^{1} = -\frac{\left(\mathbb{E}_{n}\right)^{2}}{mc^{2}} \left(\frac{2n}{2+1/2} - \frac{3}{2} - \frac{n\left((2+1/2)(2+3/2) - 2(1+1) - \frac{3}{4}\right)}{2\left((2+1/2)(2+1)\right)} \right) \\
& = -\frac{\left(\mathbb{E}_{n}\right)^{2}}{mc^{2}} \left(\frac{2n}{2+1/2} - \frac{3}{2} - n \frac{2^{2} + 2l + 3/4}{2\left((2+1/2)(2+1)\right)} \right) \\
& = -\frac{\left(\mathbb{E}_{n}\right)^{2}}{mc^{2}} \left(\frac{2n}{2} - \frac{3}{2} - \frac{n}{\left(2+1/2\right)(2+1)} \right) \\
& = -\frac{\left(\mathbb{E}_{n}\right)^{2}}{mc^{2}} \left(-\frac{3}{2} + \frac{2nl + 2n - n}{2\left(2+1/2\right)(2+1)} \right) \\
& = -\frac{\left(\mathbb{E}_{n}\right)^{2}}{2mc^{2}} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{2mc^{2}}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} + \frac{2n(2+1/2)}{2\left(2+1\right)} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2} \right) \\
& = \frac{1}{2} \left(\frac{3}{2} - \frac{4n}{2}$$

$$E'_{rel} + E'_{spinorbit} = \frac{-(E_n)^2}{mc^2} \left(\frac{2n}{1+1/2} - \frac{3}{2} - n \frac{(1+1/2)(1-1/2) - 1(1+1) - \frac{3}{4}}{1(1+1/2)(1+1)} \right)$$

$$= -\frac{(E_{n})^{2}}{mc^{2}} \left[\frac{2n}{k^{2}} - \frac{3}{2} - n \cdot \frac{(2\pi i)^{2}}{2(2\pi i)^{2}} \right]$$

$$= -\frac{(E_{n})^{2}}{mc^{2}} \left[-\frac{3}{2} + \frac{2nl + n}{2(2\pi i)^{2}} \right]$$

$$= -\frac{(E_{n})^{2}}{mc^{2}} \left[-\frac{3}{2} + \frac{2n(2\pi i)^{2}}{2(2\pi i)^{2}} \right] = \frac{(E_{n})^{2}}{2mc^{2}} \left[3 - \frac{4n}{j + 1/2} \right]$$

$$= -\frac{(E_{n})^{2}}{mc^{2}} \left[-\frac{3}{2} + \frac{2n(2\pi i)^{2}}{2(2\pi i)^{2}} \right] = \frac{(E_{n})^{2}}{2mc^{2}} \left[3 - \frac{4n}{j + 1/2} \right]$$
Using $l = (l - \frac{1}{2}) + \frac{1}{2} = j + \frac{1}{2}$

$$\Delta E = \frac{(-13.6 \text{ eV})}{3^2} - \frac{(-13.6 \text{ eV})}{2^2} = -1.89 \text{ eV}$$

Recall that including fine structure,

$$E_{nj} = -\frac{13.6 \text{ eV}}{n^2} \left[1 + \frac{\alpha^2}{n^2} \left(\frac{n}{j + v_2} - \frac{3}{4} \right) \right]$$

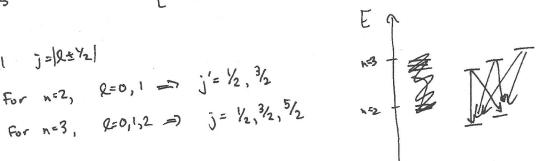

$$\Delta E = E_{3j} - E_{2j''} = \frac{-13.6 \text{ eV}}{9} \left[1 + \frac{\alpha^2}{9} \left(\frac{3}{j + \frac{1}{4}} - \frac{3}{4} \right) \right] + \frac{13.6 \text{ eV}}{4} \left[1 + \frac{\kappa^2}{4} \left(\frac{2}{j + \frac{1}{4}} - \frac{3}{4} \right) \right]$$

$$= 13.6 \text{ eV} \cdot \left[\frac{1}{4} - \frac{1}{9} + \frac{\alpha^2}{8(j' + \frac{1}{4})} - \frac{3\alpha^2}{64} - \frac{\kappa^2}{27(j + \frac{1}{4})} + \frac{\alpha^2}{108} \right]$$

Of
$$f_{5} = 13.6 \text{ eV} \cdot x^{2} \cdot \left[\frac{1}{8(j' + \sqrt{2})} - \frac{1}{27(j + \sqrt{2})} + \frac{1}{108} - \frac{3}{64} \right]$$

exall
$$j=|2\pm 1/2|$$

for $n=2$, $Q=0,1=7$ $j'=\frac{1}{2},\frac{3}{2}$
For $n=3$, $Q=0,1,2=7$ $j=\frac{1}{2},\frac{3}{2},\frac{5}{2}$

Therefore, we expect to get 6 different Balmer Lines.

$$A = \frac{\frac{1}{2} \frac{3}{2}}{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} - \frac{3}{64}}$$

$$\frac{\frac{1}{2} \frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} - \frac{3}{64}}{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} \cdot \frac{3}{64}}$$

$$\frac{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} \cdot \frac{3}{64}}{\frac{9}{1} \cdot \frac{1}{108} \cdot \frac{3}{64}}$$

$$\frac{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} \cdot \frac{3}{64}}{\frac{9}{1} \cdot \frac{1}{108} \cdot \frac{3}{64}}$$

$$\frac{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} \cdot \frac{3}{64}}{\frac{9}{1} \cdot \frac{1}{108} \cdot \frac{3}{64}}$$

$$\frac{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} \cdot \frac{3}{64}}{\frac{9}{1} \cdot \frac{1}{108} \cdot \frac{3}{64}}$$

$$\frac{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} \cdot \frac{3}{64}}{\frac{9}{1} \cdot \frac{1}{108} \cdot \frac{3}{64}}$$

$$\frac{\frac{3}{2} \frac{3}{8} \cdot \frac{1}{108} \cdot \frac{3}{64}}{\frac{9}{1} \cdot \frac{1}{108} \cdot \frac{3}{64}}$$

$$\frac{\frac{3}{2} \cdot \frac{3}{108} \cdot \frac{3}{108}}{\frac{9}{1} \cdot \frac{3}{108} \cdot \frac{3}{108}}$$

$$\frac{\frac{3}{2} \cdot \frac{3}{108} \cdot \frac{3}{108}}{\frac{9}{108} \cdot \frac{3}{108}}$$

$$\frac{\frac{3}{2} \cdot \frac{3}{108}}{\frac{9}{108}} \cdot \frac{3}{108}$$

Joeguenties in alexan

$V_2-V_1 = 3.23 \times 10^9 \text{ Hz}$ $V_3-V_2 = 1.08 \times 10^9 \text{ Hz}$
N-V = 1.08 × 109 H2
72-72 = 1.08 × 10 TH2
77 7 7 8
V4-13 = 6.60×109 H2
1112
V4-V5 = 1.08×109HZ

3. (Griffiths 6.21)

$$\begin{vmatrix}
20 \frac{1}{2} & \frac{1}{2} \\
21 \frac{1}{2} & \frac{1}{2}
\end{vmatrix}
= \frac{-13.6 \text{ eV}}{4} \left(1 + \frac{\cancel{\cancel{\times}}^2}{4} \left(2 - \frac{3}{4}\right)\right) = -3.4 \text{ eV} \left(1 + \frac{5\cancel{\cancel{\times}}^2}{16}\right)$$

$$\begin{vmatrix}
21 \frac{1}{2} & \frac{1}{2} \\
21 \frac{1}{2} & \frac{1}{2}
\end{vmatrix}
= \frac{-13.6 \text{ eV}}{4} \left(1 + \frac{\cancel{\cancel{\times}}^2}{4} \left(\frac{2}{2} - \frac{3}{4}\right)\right) = -3.4 \text{ eV} \left(1 + \frac{\cancel{\cancel{\times}}^2}{16}\right)$$

$$\begin{vmatrix}
21 \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\
21 \frac{1}{2} & \frac{1}{2} & \frac{1}{2}
\end{vmatrix}
= \frac{-13.6 \text{ eV}}{4} \left(1 + \frac{\cancel{\cancel{\times}}^2}{4} \left(\frac{2}{2} - \frac{3}{4}\right)\right) = -3.4 \text{ eV} \left(1 + \frac{\cancel{\cancel{\times}}^2}{16}\right)$$

We should first calculate the Lundé g-factor for each state

$$\frac{1}{9^{-1}} = \frac{\frac{1}{2} \frac{3}{2} + \frac{3}{4}}{\frac{3}{2} \frac{3}{2} + \frac{3}{4}} = 1 + \frac{\frac{3}{2}}{\frac{3}{2}} = \frac{2}{2}$$

$$9_{5} = 1 + \frac{\frac{1}{2}(\frac{3}{2}) - 1(2) + \frac{3}{4}}{2 \cdot \frac{1}{2}(\frac{3}{2})} = 1 + \frac{\frac{3}{2} - 2}{\frac{2}{3}} = 1 + -\frac{\frac{1}{2}}{\frac{3}{2}}$$

$$= \frac{2}{3}$$

$$\frac{Q_{=1} \cdot j_{=3/2}}{g_{J} = 1 + \frac{2}{2}} = \frac{2}{2} \frac{2}{2} \frac{2}{2} \frac{3}{2} \frac{3}{2} \frac{5}{2} - 1(2) + \frac{3}{4}}{2 \cdot \frac{3}{2} \cdot \frac{5}{2}}$$

Recall,

$$\frac{12 \cdot 3/2 \cdot 3/2}{12 \cdot 13/2 \cdot 3/2} = \frac{12 \cdot 13/2 \cdot 3/2}{3} = \frac{12 \cdot 13/2 \cdot 13/2}{3} = \frac{12 \cdot$$

$$-3.4\left(1+\frac{5x^{2}}{16}\right)e^{3/2}$$

$$-3.2\left(1+\frac{5x^{2}}{16}\right)e^{3/2}$$

then
$$E_Z^1 = \frac{e}{3m} \vec{B}_{ext} \cdot \langle \vec{L} + 2\vec{S} \rangle = \frac{e}{m} \vec{B}_{ext} \cdot \langle \vec{S} \rangle$$

Take $\vec{B}_{ext} = \vec{B}_{ext} \hat{z}$, then $E_Z^1 = \frac{e}{m} \vec{B}_{ext} \cdot (\vec{S}_Z) = (\frac{e}{m} \vec{B}_{ext} \cdot \vec{m}_S \hat{b})$

Fine Stancture Para,

Note: this is the total energy, including $E^{(0)}$.

The Standard Para,
$$E_{nj} = -\frac{13.6 \text{ eV}}{n^2} \left[1 + \frac{\alpha^2}{n^2} \left(\frac{n}{j + \frac{1}{2}} - \frac{3}{4} \right) \right]$$

$$= -\frac{13.6 \text{ eV}}{n^2} \left[1 + \frac{\alpha^2}{n^2} \left(n - \frac{3}{4} \right) \right]$$

$$= -\frac{13.6 \text{ eV}}{n^2} \left[1 + \frac{\alpha^2}{n^2} \left(n - \frac{3}{4} \right) \right]$$

$$\Rightarrow E_{f_0}' = -\frac{13.6 \text{ eV } \alpha^2}{n^4} \cdot \left(n - \frac{3}{4}\right) = + \frac{13.6 \text{ eV } \alpha^2}{n^3} \left(\frac{3}{4n} - 1\right)$$

Note that since $[S_z, H] = 0$, the weak and strong bases are the same, so $E_z' = \frac{eB_{ext} m_s h}{m}$ is the correct Zeeman contribution regardless of the strength of the perturbation.

$$H'=-d'\cdot E'$$
 Take $E'=(0,0,E_0)$
Then $H'=-q|d'|\cos(\theta)E_0=-qd\cos(\theta)E_0$
constant $d=|d'|$

Now we want to compute (l'm/|H'|lm) to get the matrix elements. However note that Lz commutes with both H' and H' so we can use eigenstates of Lz as the "good states" and only need nondegenerate perturbation theory.

But why is $[H', L_z] = 0$ is a standard result, so $[H', L_z] = 0$.

But why is $[H', L_z] = 0$?? Well, $L_z = \frac{h}{i} \frac{d}{d\phi}$ and H' is independent of the variable ϕ , so we are done! $\int_{i}^{\infty} \frac{d\phi}{d\phi} d\phi$

So in fact we only need (lm/H/lm) (l=l and m=m)
But (lm/cos@)|lm)=0! So the first order correction is 0.

You can argue this by a parity argument or pick for instance l=1 to get afeel for why this is O. Then generalize to arbitrary 2...

(In fact, the only non-zero matrix elements happen to be (l±1 m/cos(0) | 2 m). Proving this for general lis abit delicate as it requires the use of recursion relations on the spherical harmonics $Y_{e,m}(\theta, \phi)$: $\cos(\theta) Y_{e,m} = \sqrt{\frac{(l+1)^2 - m^2}{4(l+1)^2 - 1}} Y_{e+1,m} + \sqrt{\frac{l^2 - m^2}{4l^2 - 1}} Y_{e-1,m}$ My You can ask me for details in office hours...

a)
$$H' = \frac{-e}{z_{mc}} B_{c} L_{z}$$
 Since $B = (0, 0, B_{o})$ and $L' = (L_{x}, L_{y}, L_{z})$

Note Lz commutes with H' (obviously...) and Lz still commutes with Ho (same Ho as previous problem)

So use nondegenerate perturbation theory with "good states" | lm).

See part b) For the l=1 example ...

b) For simplicity, neglect the electron spin.

Porbital @ l=1.

Consider states, (n1m) where m=0,±1 w/n fixed.

As above,

 $\langle n \mid m' \mid \hat{H}' \mid n \mid m \rangle = \delta_{mm'} \left(-\frac{eB}{2mc} \right) m_e \hat{n} \in \mathbb{Z}$ diagonal as in (a).

$$E_{m_0}^{(i)} = -\frac{eB}{2mc} m_0$$

$$E_{m_0}^{(i)} = -\frac{eBh}{2mc}$$

$$E_{m_0}^{(i)} = -\frac{eBh}{2mc}$$

$$E_{m_0}^{(i)} = 0$$

$$E_{m_0}^{(i)} = 0$$
